

More than one analysis is shown for wells UE-25b%1, USW H-1, USW VH-1, and UE-29a/2. The multiple analyses permit a comparison of water compositions as a function of volume of water pumped. The sample obtained on July 20, 1982, from UE- 25b+1 was collected after 28 days of pumping of an interval 863 to 875 m below the land surface (Daniels and others, 1982). This interval was isolated using inflatable packers. Well USW H-1 was first sampled on October 20, 1980, after drilling to a depth of 687
